

Activity: UML Final Project – Title & Design Proposal

1. Project Title

- **A Web-Based Laundromat Management System (WASHMATE)**

2. Problem Statement

- Laundromat (WASHMATE) still use manual methods to manage customer orders, laundry status, and payments. These processes often cause problems such as inaccurate records, misplaced laundry, long waiting times, and difficulty in tracking daily sales and operations. Because there is no centralized system, managing customer information and generating reports becomes time-consuming. To address these issues, a web-based system is needed to automate laundromat operations and improve service efficiency.

3. Project Objectives

- Automate the recording and management of customer laundry orders
- Provide real-time tracking of laundry status (e.g., received, washing, ready for pickup)
- Improve accuracy of sales and transaction records
- Simplify payment processing and report generation

4. Target Users

- **Administrator** – Manages users, services, pricing, and reports
- **Staff** – Handles customer orders, updates laundry status, and processes payments
- **Customer** – Submits laundry requests and monitors order status

5. System Scope

What is included and excluded?

Included:

The system includes all features necessary to manage laundromat operations online. This covers **user authentication (login/register accounts)** for administrators, staff, and customer, and **manage user accounts** by the administrator. It also includes managing **services and pricing**, processing **laundry orders**, updating and tracking **laundry status**, processing **payments**, generating **reports**, and sending **notifications** to customers. The system supports three main users: Administrator, Staff, and Customer, each with specific roles and permissions. All transactions and records are stored and managed within the web-based platform.

Excluded:

The system does not include physical laundry operations such as washing, drying, ironing, or delivery handling. It also does not cover hardware maintenance of machines, inventory management of detergents or supplies (unless separately specified), or third-party banking system control (it only processes payments, not manages banks). Additionally, the system does not include advanced features such as mobile app development, AI-based recommendations, or integration with external logistics services unless specifically expanded in future versions.

6. UML Diagram (Use Case Diagram)
